

PRE-SEED | \$5M TARGET

Make change the unit of compute

Bring one workload. Measure wasted state movement. Decide fit with evidence.

PROBLEM

Customers already know the pain

Battery

dies too quickly

Hardware

is maxed out

Heat

systems run hot

Cost

more performance is needed

MECHANISM

Reference state plus accumulated change

current_state = reference_state XOR accumulated_delta

LOAD

set reference

ACCUM

add deltas

READ

reconstruct

SWAP

commit boundary

PROOF TODAY

Real, specific, evidence-labeled

**Zynq UI**

HARDWARE_VALIDATED

**Linux-to-FPGA**

HARDWARE_VALIDATED

**AX7020 matrix**

LIVE_MEASURED with caveats

**Lean4 algebra**

FORMAL_PROOF where audited

COMMERCIAL PATH

Show the problem path; measure fit

Show us

the constrained path

Evaluate

fit against baseline

Show evidence

measurement + impact

Call no-fit

if ATOMiK does not help

ASK

\$5M to reach measured workload proof

Capital

\$5M target pre-seed

Entry wedge

paid evals -> licensing optionality

Output

proof + IP packet + ASIC feasibility

Need

workloads + design-partner/advisor intros

Planning model: entry wedge from paid evaluations to licensing/strategic optionality if proof holds. Final SAFE terms require counsel/CFO.

This round does not fund tape-out.
