

ATOMiK — Customer & Sales Pipeline

ATOMiK · State-Aware Compute Architecture · Pre-Seed · May 2026

CONFIDENTIAL DATA ROOM DOCUMENT

Current Status

ATOMiK is pre-revenue. No signed customer contracts or LOIs exist as of May 2026. This document describes the pipeline strategy and evaluation offer structure.

Evaluation Offer

Standard entry point: Bring one state-heavy workload, your current baseline, and the constraint that already hurts.

ATOMiK delivers: workload map, baseline comparison, evidence map, fit/no-fit recommendation, and next-step plan.

This can be structured as: (a) unpaid feasibility conversation, (b) paid technical evaluation (SOW-based), or (c) design-partner engagement with IP access.

Target Segment Priority

Segment	Pain & Entry Point
Edge / embedded OEMs	Battery, heat, bandwidth-constrained products (IoT, industrial, automotive edge)
Defense / remote systems	Size, weight, power (SWaP) constrained; packet budget; field runtime
AI at the edge	Context movement, memory pressure, local inference latency
Data center / infrastructure	Strategic expansion path — requires edge proof first

Active Outreach

Investor, advisor, and design-partner outreach notes should be kept in the controlled data room. Do not present conversations as pipeline unless there is a confirmed meeting, LOI, paid evaluation, or customer artifact.

Pipeline Tracker

Use these controlled diligence tables for updates. Keep unknowns as TBD rather than implying traction.

Segment Strategy

Segment	Primary pain	Entry point	Status
Edge / embedded OEM	Battery, heat, bandwidth	State-heavy device workload	Target
Robotics / industrial edge	Latency, reliability, control updates	Sync/control path	Target
Defense-adjacent remote systems	SWaP, packet budget, runtime	Remote state-transfer constraint	Target
AI-at-the-edge context state	Context movement, memory pressure	Representative context-state update	Target

Controlled Tracker

Owner for current tracker rows: Founder. Current evidence for all rows: none yet unless updated with a confirmed meeting, workload, LOI, paid evaluation, or customer artifact.

Edge / Embedded OEM

Source/status: intro, outbound, or advisor target. Next action: identify workload owner and painful constraint. Proof gate: workload map, baseline, and signed SOW. Note: do not call pipeline until meeting or artifact exists.

Robotics / Industrial Edge

Source/status: advisor or outbound target. Next action: find a state-heavy sync/control path. Proof gate: trace, baseline, and success metric. Note: likely design-partner fit if the constraint is expensive.

Defense-Adjacent Remote Systems

Source/status: connector or advisor target. Next action: qualify packet, radio, or SWaP constraint. Proof gate: NDA, workload map, and baseline. Note: treat as controlled; no public customer claims.

AI-at-the-Edge Context State

Source/status: outbound or technical advisor target. Next action: frame as context-state update, not AI inference. Proof gate: representative trace and correctness oracle. Note: avoid generalized AI performance claims.

LOI & Contract Templates

Paid evaluation proposal template: [business/design_partners/paid_evaluation_proposal.md](#)

LOI outline: [business/design_partners/loi_outline.md](#)

No signed LOIs or customer contracts exist as of this writing. First signed agreement is a key pre-seed milestone.

Pipeline Gate

The \$400K customer proof budget funds the first 1-3 evaluation efforts if qualified workloads are available. Success metric: measured improvement on one agreed metric while preserving correctness, with raw artifacts and a claims registry entry.
