

Point-by-Point Response to Reviewer and Editorial Comments

Journal: Scientific Reports

Manuscript Title: ATOMiK: Empirical Validation of Delta-State Computation with Hardware Verification

Submission ID: 48fda3aa-5926-4342-bae4-0c5b47aac61b

Author: Matthew H. Rockwell

Editor Comment 1: Data availability statement mismatch

Comment: Kindly ensure that the data availability statement both in the manuscript file and in the submission system matches the same.

Response:

We thank the editor for identifying this discrepancy. The Data Availability statement has been updated in the manuscript to exactly match the statement provided in the submission system.

The revised Data Availability statement now reads as follows:

"The data supporting the findings of this study are openly available. Source code, hardware description files, experimental artifacts, and supporting documentation for the ATOMiK architecture are available in the public GitHub repository at <https://github.com/MatthewHRockwell/ATOMiK>. Additional supplementary materials and preprint resources are available via Zenodo. No proprietary datasets were generated or analyzed during the current study."

No additional experiments were required in response to this editorial request, as the revision concerned consistency of documentation rather than experimental content. All experimental validation, hardware verification, and benchmarking results remain unchanged from the original submission.

We confirm that the revised manuscript file and submission system entry now contain identical Data Availability statements.

Sincerely,

Matthew H. Rockwell
