

Executive Summary

ATOMiK · State-Aware Compute Architecture · Pre-Seed · May 2026

What ATOMiK Is

ATOMiK is a state-aware compute architecture that helps constrained edge, embedded, and AI-at-the-edge teams evaluate whether they can reduce wasted state movement by tracking meaningful change instead of repeatedly moving, scanning, syncing, replaying, or rebuilding full state.

The company is raising a \$2.0M target pre-seed to move from hardware-backed primitive proof to measured customer workload proof, IP diligence, and ASIC feasibility. The round does not fund tape-out.

Why It Matters

- Buyer pain: battery budget, enclosure heat, link budget, update latency, reliability, size, and weight.
- First wedge: one state-heavy workload, one current baseline, and one painful constraint expensive enough to evaluate.
- Why now: energy, bandwidth, thermal, and local-compute pressure are rising; IEA/LBNL figures are market context, not ATOMiK savings claims.

Evaluation Offer

Give us	One state-heavy workload, current baseline, and painful constraint.
We evaluate	Where state movement creates waste and whether ATOMiK can improve that path.
You receive	Workload map, baseline comparison, evidence map, fit/no-fit recommendation, and next-step plan.
Success	Measured improvement against one agreed metric while preserving correctness.

Proof Today

Artifact	Evidence Boundary
Zynq Desk v0.39-K	HARDWARE_VALIDATED — live prototype UI proof image; not product maturity or performance proof.
Linux userspace to FPGA	HARDWARE_VALIDATED — documented OS-to-bus path with 16/16 property checks.
AX7020 matrix	LIVE_MEASURED — workload-specific wins and losses; quote with caveats.
Formal proof foundation	FORMAL_PROOF where directly audited; otherwise SOFTWARE_VALIDATED / proof work present. Counts withheld until reconciled.
SD boot artifacts	BUILD_ARTIFACT — build output exists; power-on run artifact still gated.

Business Path

Paid proof reviews and technical evaluations -> design-partner evaluations -> IP/licensing diligence -> strategic licensing or platform partnership if workload proof supports it.

Return narrative: pre-seed capital buys diligence assets a strategic partner can evaluate: workload proof, IP status, integration path, and ASIC feasibility. No exit, valuation, or return multiple is implied.

Ask

Target	\$2.0M pre-seed; \$1.25M minimum; \$2.75M stretch.
Use	\$600K engineering, \$400K customer proof, \$300K IP/legal, \$300K ASIC feasibility, \$400K ops/reserve.
Need	Capital, design-partner introductions, qualified workload access, and ASIC/IP diligence support.
Pending	SAFE terms, valuation cap, discount, and close mechanics require CFO/counsel approval.

Not Claimed

No universal speedup, production readiness, guaranteed battery/heat/cooling/water savings, smaller hardware claim, signed customer traction, or funded tape-out.
